

Value Proposition for Exchanges

RS Metrics – Company and Product Overview

RS Metrics® provides analysis-ready data for environmental, climate, and physical risk themes using direct measurements of companies' asset level activities.

ESGSignals®, RS Metrics' SaaS platform, is the industry-leading geospatial AI-driven analytics platform that allows stakeholders to easily access objective and comparable asset-level environmental and climate physical risk data for companies. ESGSignals® provides data about company physical assets mapped to ownership, asset type, sector, country etc. making it possible to conduct: (i) asset-level risk assessments, (ii) company, industry, sector level risk evaluation, (iii) baselining and benchmarking, (iv) portfolio screening, monitoring and engagement and more.

Context

Against a backdrop of a wide variety of ESG standards and frameworks, companies are increasingly beginning to measure and report on their emissions as a way to measure and manage transition risk. However, stakeholders across the financial value chain are increasingly aware that they lack the ability to assess climate physical risk and biodiversity. Accessing this foundational data is a far more complex task than emissions measurement, presenting huge issues of complexity and accessibility. This is why RS Metrics® has partnered with Google Cloud to democratize access to our platform of over 100 asset-level climate metrics via SAAS, DAAS, or Dashboards.

Value

RS Metrics provides access to data, insights, and tools to customize the themes that customers are most interested in. You can get:

- Proprietary data - asset-level data for 3000 of the world's largest companies - covering 100 metrics per asset
- Primary data - which can be used for both business intelligence and for reporting for governments, public, and private sectors and integrated with other processes
- A full technology stack - which allows you to build ESG / ECP applications with the ability to pull in multiple geospatial datasets, which will allow you to create frameworks / applications
- Portfolio Solutions - through leveraging ESGSignals® and AssetTracker, you can do modular and configurable portfolio construction, monitoring, and management platform that powers actively managed ECP portfolios and structured products including equity indexes, real estate indexes, fixed income and model portfolios

Problem

Lack of accessibility to comprehensive objective ESG / ECP (Environmental, Climate and Physical Risk) data is the most acute problem in Capital Markets, driven by the high levels of complexity, scale and expertise needed to measure the data, and compounded by lack of visibility into suppliers, customers and other stakeholders.

BYOA - Bring Your Own Assets is a feature of ESGSignals® that allows customers to add their own assets to the dashboard by providing their location.

Properly monitoring, managing, and reporting progress against targets and commitments requires accurate, timely, and reliable data on the performance of a company's principal assets and operations on these environmental dimensions. **And so as with financial data, this data will increasingly be communicated to stakeholders and the market directly by companies and through data aggregators.**
